

## The basics of a UHF transmitter

Technological advancements are taking place so fast that it becomes difficult for people to keep pace with the everyday changes. The case is exactly like this when it comes to spy equipment because this is an industry that thrives on technological evolution.&nbsp;

Millions of dollars are spent on research and development everyday in order to come with a better and more technologically advanced gadget that beats the performance of the previous one and has some added features in it as well. Such is the case when it comes to the UHF transmitter.

The UHF transmitter is a relatively new device that has proven to be one of the most effective spy gadgets around for security and surveillance purposes. But many people are confused or unaware of how this device is different from a VHF device or an FM bug.&nbsp;

Although both the FM bug and the UHF transmitter are wireless devices that are designed for the purpose of transmitting voice and other sounds to the receiver they do have some differences. The major difference is in the field of performance. When you analyze the Ultra High Frequency range it gives far more advantages to as a wireless listening device when compared with a VHF device and an FM bug.&nbsp;

The things that set the UHF transmitter apart from other devices are

**Size-** The UHF transmitter is much smaller in size than a VHF device and an FM bug. In fact you will be able to get the UHF transmitter in an Ultra miniature version that makes it really easy to conceal hence leaving no chance of it being detected.

**Weight-** The small size also gives it a much lighter weight which again helps in the concealment and carrying of the device hence enabling it to go by unnoticed.

**Sound quality-** The ultra high frequency device has been observed to have much better sound quality than its predecessors. Even the slightest of whispers and the most vivid of sounds can be heard crystal clear on the receiving end.&nbsp;

**Reception-** In terms of reception the UHF device far exceeds the range that was possible to capture by the VHF devices and FM bugs. This device has the ability to capture the slightest of whispers at the greatest of distances. This is one of the most outstanding qualities that have contributed to the world wide success of the device.

**Battery life-** The UHF transmitters can go months without the need to be charged. You can just mount them where you need them and leave them for months and they will keep working. This is quite unlike the other devices that need to be charged after every couple of days.

**Indestructible design-** This little yet powerful device has been specifically designed in a manner that it is virtually indestructible. It is highly reliable because of its shock resistant attributes. When we analyze all these basic qualities of the UHF transmitter we realize that it is a much better choice for professional use.
